Mesh Editing Overview

Mesh Editing Overview

Mesh Editing Overview

This is not what we want!

Mesh Editing Overview

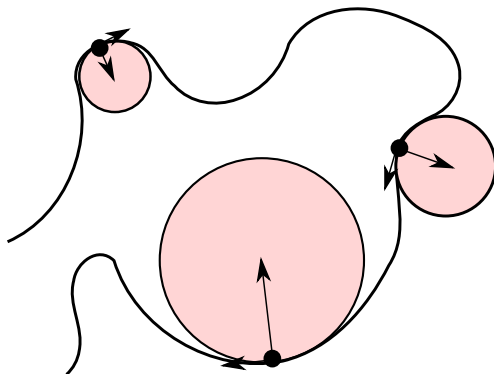

Mesh Editing Overview

This is much better! Preserve *relative information* about points to neighbors

Parameterized Curves / Curvature

Curvature κ is $\frac{1}{r}$, where r is radius of *osculating circle*

Parameterized Curves / Curvature

Curvature κ is $\frac{1}{r}$, where r is radius of *osculating circle*

Curvature can also be considered as a vector $\kappa \vec{n}$

$$\gamma(t) = (x(t), y(t))$$

Velocity

$$\gamma'(t) = \left(\frac{dx(t)}{dt}, \frac{dy(t)}{dt} \right)$$

Parameterized Curves / Curvature

$$\gamma(t) = (x(t), y(t))$$

Velocity

$$\gamma'(t) = \left(\frac{dx(t)}{dt}, \frac{dy(t)}{dt} \right)$$

Assume *parameterized by arc length*; that is, curve moving at a unit speed. In other words

$$\gamma'(t) \cdot \gamma'(t) = 1$$

Parameterized Curves / Curvature

$$\gamma(t) = (x(t), y(t))$$

Velocity

$$\gamma'(t) = \left(\frac{dx(t)}{dt}, \frac{dy(t)}{dt} \right)$$

Assume *parameterized by arc length*; that is, curve moving at a unit speed. In other words

$$\gamma'(t) \cdot \gamma'(t) = 1$$

Differentiate both sides with respect to t , use product rule, end up with

$$2\gamma''(t) \cdot \gamma'(t) = 0 \implies \gamma''(t) \perp \gamma'(t)$$

$\gamma''(t) = \kappa \vec{n}(t)$ is the *curvature vector*

Discrete Curvature

Derivative at point i (velocity vector) is approximately

$$\vec{v}_i = \vec{x}_i - x_{i-1}$$

Discrete Curvature

Derivative at point i (velocity vector) is approximately

$$\vec{v}_i = \vec{x}_i - \vec{x}_{i-1}$$

Second derivative (curvature vector) is approximately

$$\vec{n}_i = \vec{v}_{i+1} - \vec{v}_i = \vec{x}_{i+1} - \vec{x}_i - (\vec{x}_i - \vec{x}_{i-1}) = -2\vec{x}_i + \vec{x}_{i-1} + \vec{x}_{i+1}$$

Curvature of Surfaces

Cut surface with plane, look at curvature of curve going through point

Courtesy of Keenan Crane, *Discrete Differential Geometry: An Applied Introduction*

Discrete Mean Curvature Approximation

Still just a difference of a point with its neighbors! Convention is **negative** the curvature vector: $-H(v_i)\vec{n}_i$, where $H(v_i)$ is the *mean curvature*

Example with curvature

Example with flat

Table of Contents

- ▷ Mesh Editing Overview / Discrete Curvature

Laplacian Mesh Matrix

4	-1	-1	-1	-1					
-1	3	-1	-1						
-1	-1	5	-1		-1	-1			
	-1	-1	4			-1			-1
-1				3	-1		-1		
-1		-1			4	-1	-1		
		-1	-1		-1	6	-1	-1	-1
				-1	-1	-1	6	-1	-1
						-1	-1	3	-1
			-1			-1	-1	-1	4

Sorkine05

$$L_{ij} = \left\{ \begin{array}{ll} -1 & \text{edge connecting } i \text{ and } j \\ \text{degree}(i) & i = j \\ 0 & \text{otherwise} \end{array} \right\}$$

Graph Laplacian

More generally, $L = D - A$

▷ A : “Adjacency matrix”

$$A_{ij} \begin{cases} 1 & \text{edge connecting } i \text{ and } j \\ 0 & \text{otherwise} \end{cases}$$

▷ D : “Degree matrix”

$$D_{ij} = \begin{cases} \text{degree}(i) = \sum_{j=1}^N A_{ij} & i = j \\ 0 & \text{otherwise} \end{cases}$$

L is *symmetric* and *sparse*. Number of nonzero entries is $O(N)$ for meshes of constant genus

Laplacian Mesh Editing

$$\delta_i = \sum_{j \in N(i)} (v_i - v_j) = d_i v_i - \sum_{j \in N(i)} v_j$$

Can be written as $Lv = \delta$. Each vector is *along a row* now

L	v1x	v1y	v1z	=	δ1x	δ1y	δ1z
	v2x	v2y	v2z		δ2x	δ2y	δ2z
	v3x	v3y	v3z		δ2x	δ2y	δ2z
	⋮	⋮	⋮		⋮	⋮	⋮
	⋮	⋮	⋮		⋮	⋮	⋮
	⋮	⋮	⋮		⋮	⋮	⋮
	vNx	vNy	vNz		δ2x	δ2y	δ2z

Laplacian Mesh Editing

$$\delta_i = \sum_{j \in N(i)} (v_i - v_j)$$

Can we reconstruct v from δ ?

L	v1x	v1y	v1z	=	δ1x	δ1y	δ1z
	v2x	v2y	v2z		δ2x	δ2y	δ2z
	v3x	v3y	v3z		δ2x	δ2y	δ2z
	⋮	⋮	⋮		⋮	⋮	⋮
	⋮	⋮	⋮		⋮	⋮	⋮
	⋮	⋮	⋮		⋮	⋮	⋮
	vNx	vNy	vNz		δ2x	δ2y	δ2z

Laplacian Mesh Editing

$$\delta_i = \sum_{j \in N(i)} (v_i - v_j)$$

Can we reconstruct v from δ ? *No: L is rank $N - 1$ for a connected mesh*

L				=			
	v1x	v1y	v1z		δ_{1x}	δ_{1y}	δ_{1z}
	v2x	v2y	v2z		δ_{2x}	δ_{2y}	δ_{2z}
	v3x	v3y	v3z		δ_{2x}	δ_{2y}	δ_{2z}
	⋮	⋮	⋮		⋮	⋮	⋮
	⋮	⋮	⋮		⋮	⋮	⋮
	⋮	⋮	⋮		⋮	⋮	⋮
vNx	vNy	vNz	⋮	⋮	⋮		

Laplacian Mesh Editing: Anchors

$$\delta_i = \sum_{j \in N(i)} (v_i - v_j)$$

Delta coordinates define geometry *up to a translation*.
Fix a point v_a , fix translation

Laplacian Mesh Editing: Anchors

Can add more anchors, but may not be a solution

Laplacian Mesh Editing: Anchors

Can add more anchors, but may not be a solution Solve in the *least squares sense*

$$\tilde{v} = \operatorname{argmin}_v \|Lv - \delta\|_2^2 + \sum_{s=1}^k w_s \|v_s - x_s\|_2^2$$

000 ... w_a ... 000

00...w_b..... 0000

=

w_a (x_a)

w_b (x_b)

Laplacian Mesh Editing: Anchors: Another Example

Laplacian Mesh Editing: Anchors

$$\tilde{v} = \operatorname{argmin}_v \|Lx - \delta\|_2^2 + \sum_{s=1}^k w_s \|x_s - v_s\|_2^2$$

Laplacian Mesh Editing: Anchors

$$\tilde{v} = \operatorname{argmin}_v \|Lx - \delta\|_2^2 + \sum_{s=1}^k w_s \|x_s - v_s\|_2^2$$

- ▷ Let \bar{L} be L augmented with the anchor rows
- ▷ Let $\bar{\delta}$ be δ augmented with the weighted anchor coordinates

Can all be written in matrix form

$$\text{Squared Error: } \epsilon(v) = \|\bar{L}v - \bar{\delta}\|_2^2$$

$$\text{Least Squares Solution: } v^* = (\bar{L}^T \bar{L})^{-1} \bar{L}^T \bar{\delta}$$

Laplacian Mesh Editing: Examples

What About Irregular Meshes?

Homer's upper arm

Cotangent Weights

$$\delta_i = \sum_{j \in N(i)} w_{ij} (v_i - v_j)$$

$$w_{ij} = \frac{1}{2} (\cot(\beta_{ij}) + \cot(\alpha_{ij}))$$

Cotangent Weights

$$\delta_i = \sum_{j \in N(i)} w_{ij} (v_i - v_j)$$

$$w_{ij} = \frac{1}{2} (\cot(\beta_{ij}) + \cot(\alpha_{ij}))$$

Figure: Nealen2006, **umbrella** vs **cotangent**

Cotangent Weights: Mean Curvature

Mean curvature is approximated by

$$\frac{1}{2} \sum_{j \in N(i)} (\cot(\beta_{ij}) + \cot(\alpha_{ij})) \|\vec{v}_i - \vec{v}_j\|_2$$

More surprises in group assignment 3 and the following lectures!

A Note About Rotation Invariance

$$Lx = \delta$$

▷ δ is a *vector*. $\|\delta\| \propto \kappa$, but it has a direction
